```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                     protein_bind

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel human conductin protein which has anti-tumour activity. Detecting the presence or amount of conductin, at protein or nucleic acid levels, is used to diagnose tumours, while agents that (re)activate conductin are used for tumour therapy. Conductin binds to beta-catenin and induces its cytoplasmic degradation, resulting in blockade of the Wnt/Wingless signalling pathway in vertebrates. Conductin also binds to Adenomatcous Polyposis Coli (APC) fragments and, in conjunction with APC, acts as a tumour suppressor.
                                                                                                                                                                                                                                                                                                                                           Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-NOV-2000

CC Portions of proteins which are associated with human colon tumour proteins CC (B11897-B11904). The nucleic acids, the polypeptides they encode, and CC antigen presenting cells (APCs, preferably dendritic cells) expressing CC such polypeptides may be used in vaccines that target tumour cells, compared to the polypeptide expressed by the APC are CC cancer. T-cells specific for the polypeptide expressed by the APC are CC used to remove tumour cells from biological samples, especially blood or CC cractions thereof. The sample or the isolated T-cells specific for the polypeptide are development. CD4+ and/or CC CD8+ T-cells from a patient may be incubated with a polypeptide or nucleic acid of the invention, or an APC expressing such a polypeptide, cc cause the proliferation of specific T-cells. The T-cells can be conceded and then administered back to the patient to inhibit cancer development. Nucleic acids encoding the polypeptides and antibodies against the polypeptides may be used to determine the expression level concerned to the invention, and therefore to determine whether CC cancer cells are present. Such diagnostic methods may also be used to cancer cells are progression of a cancer by repeating the processes at time CC present sequence represents a cDNA encoding a human colon tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Local Similarity

                                                                                                                                                                                                                                                                                                                                                                                                        Sequences A77722-A78199 represent 478 cDNAs encoding proteins or CC portions of proteins which are associated with human colon tumours. CC The invention also specifically discloses 8 human colon tumour proteins CC (B11897-B11904). The nucleic acids, the polypeptides they encode, and CC antigen presenting cells (APCs, preferably dendritic cells) expressing CC such polypeptides may be used in vaccines that target tumour cells, CC especially colon tumour cells, thereby inhibiting the development of CC cancer. T-cells specific for the polypeptide expressed by the APC are CC used to remove tumour cells from biological samples, especially blood or CC concer. The sample or the isolated T-cells specific for the CC polypeptide can then be used to inhibit cancer development. CD4+ and/or CC cD8+ T-cells from a patient may be incubated with a polypeptide or CC closed and then administered back to the patient to inhibit cancer development. Nucleic acids encoding the polypeptides and antibodies CC against the polypeptides may be used to determine the expression level CC ancer cells are present sender by repeating the processes at time CC cancer cells, and comparing the current result to provious results. The concer correct represents a connect represents a connect represents.

                                                                                                                                                                                                                                                      Nucleic acids encoding mutant and wild type Axin and coligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense molecule and identified compounds form pharmaceutical compositions in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through negative regulation of the Wnt pathway in the Nieuwkoop Center.

                                                                                                                                                                                                                                                                 Nucleic acids encoding mutant and wild type Axin and coligonucleotides derived from them are useful for detecting mutations in the Axin gene and for determining whether a subject is likely to develop cancer (including breast, colorectal, gastrointestinal, esophageal, carcinomas or melanomas). The wild type Axin and homologues of Axin are useful for treating subjects who are likely to develop cancer (thyroid carcinomas). The nucleic acids are also useful for diagnosing cancer and for detecting mutations in cancerous cells. Wild type Axin, its antisense in the treatment of cancer. The compositions are also useful for treating cancer by inhibiting tumorigenesis (by inducing degradation of beta-catenin). The nucleic acid encoding Axin acts through

The antibody recognises an antigenic determinant on the outside core in LPS of P. aeruginosa. See also Q12840.

                                                                                                                                                                                          밁
                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                                                                                                                                                                                                                A single-stranded DNA (or its complementary strand or the corresp. C double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of thuman genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-C untranslated sequence is unique to a particular mRNA, species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library call the 3'-oriented cDNAs hybridise with specific mRNAs. Each library clascent mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.

polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-YO
library is a subtracted library derived from an
individually-tagged normalized whole-eye (minus the lens).
library is previous libraries (UI-R-AO, UI-R-AI, UI-R-EO,
II-R-EO, II-R-EO, and UI-R-CO). The tag is a string of
pool of all previous libraries (UI-R-AO, UI-R-AI, UI-R-EO,
UI-R-EI, UI-R-CO), and UI-R-CO]. The tag is a string of
3-5 nucleotides present between the Not I site and the
oligo-dT track which allows identification of the library
of origin of a clone within the mixture. The subtracted
library (UI-R-YO) was constructed as follows: PCR
amplified cDNA inserts from previous library clones from
which 3' ESTs had been derived were used as a driver in a
hybridization with the normalized whole-eye library in
the form of single-stranded circles. The remaining
single-stranded circles (subtracted library) was purified
by hydroxyapatite column chromatography, converted to
double-stranded circles and electroporated into DHIOB
bacteria (Life Technologies) to generate the UI-R-YO
library. This procedure has been previously described
(Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
196)"
